# Project Narrative

## PROJECT INFORMATION

The project consists of the construction of a 10-level condominium structure. The new development will have a footprint of about 75 by 180 feet, and will rise to a maximum elevation of +158 feet NGVD. A single level basement is also planned for the development, with an anticipated finished floor elevation of 14'-2" feet NGVD. The underground parking garage will have approximate measurements of 246 feet in the east-west direction, and up to 94 feet in the north-south direction. The footprint of the garage structure is anticipated to be roughly 22,000 square feet. The new structure will be constructed about 20 feet south of the northern boundary of the site. The southern portion of the undeveloped land will include a lap pool, while the northwest portion will provide access to underground parking.

## REMOTE VIBRATION MONITORS

A total of thirteen (13) vibration monitors have been installed at this time. The units run continuously for a 24-hour period, with the exception of a short period of time to allow for the devices to download the data collected during the day. The location and identification of each device is presented in the table below and shown graphically on the map. A graph will be displayed for each monitor showing the data point collected during the specified time period. This report will display the historical data and data collected from the week of this report.

The vibration monitors were installed on the dates as listed in the table below:

## REVIEW OF VIBRATION MONITORING DATA

The following definitions identify the wording that will be used in the report to describe the vibration readings:

- Longitudinal: a vibration measurement in the axis in line with the vibration source (back and forth).
- Transverse: a vibration measurement in the axis perpendicular to the vibration source (side to side).
- Vertical: a vibration measurement in the vertical axis (up and down).
- Peak Particle Velocity (PPV): movement within the ground of molecular particles. This is not related to surface movement.

## THRESHOLD EXCEEDANCES

A vibration level threshold limit of 0.50 in/sec is being used for the project, with trigger alerts set at 0.30 in/sec, or 60 percent of the established threshold level. Listed below are the instances when the seismographs have exceeded the established threshold limit of 0.50 in/sec.:

### Notes:

<sup>1</sup> Digging with backhoe near geophone.

<sup>2</sup> Movement of debris on-site with excavator near geophone.

<sup>3</sup> Demolition of the sea wall near geophone.

<sup>4</sup> Demolition of asphalt with excavator near geophone.

<sup>5</sup> Digging and moving materials with backhoe near geophone.

<sup>6</sup> Excavator moving construction debris near monitor.

<sup>7</sup> Monitor inadvertently bumped during inspection of the VM equipment.

<sup>8</sup> Excavator moving in close proximity to VM equipment.

<sup>9</sup> Unit was bumped into during excavation activity. No damage was caused but resulted in a disturbance of the readings at this time.

<sup>10</sup> VM system was relocated by a subcontractor on-site while the unit was monitoring.

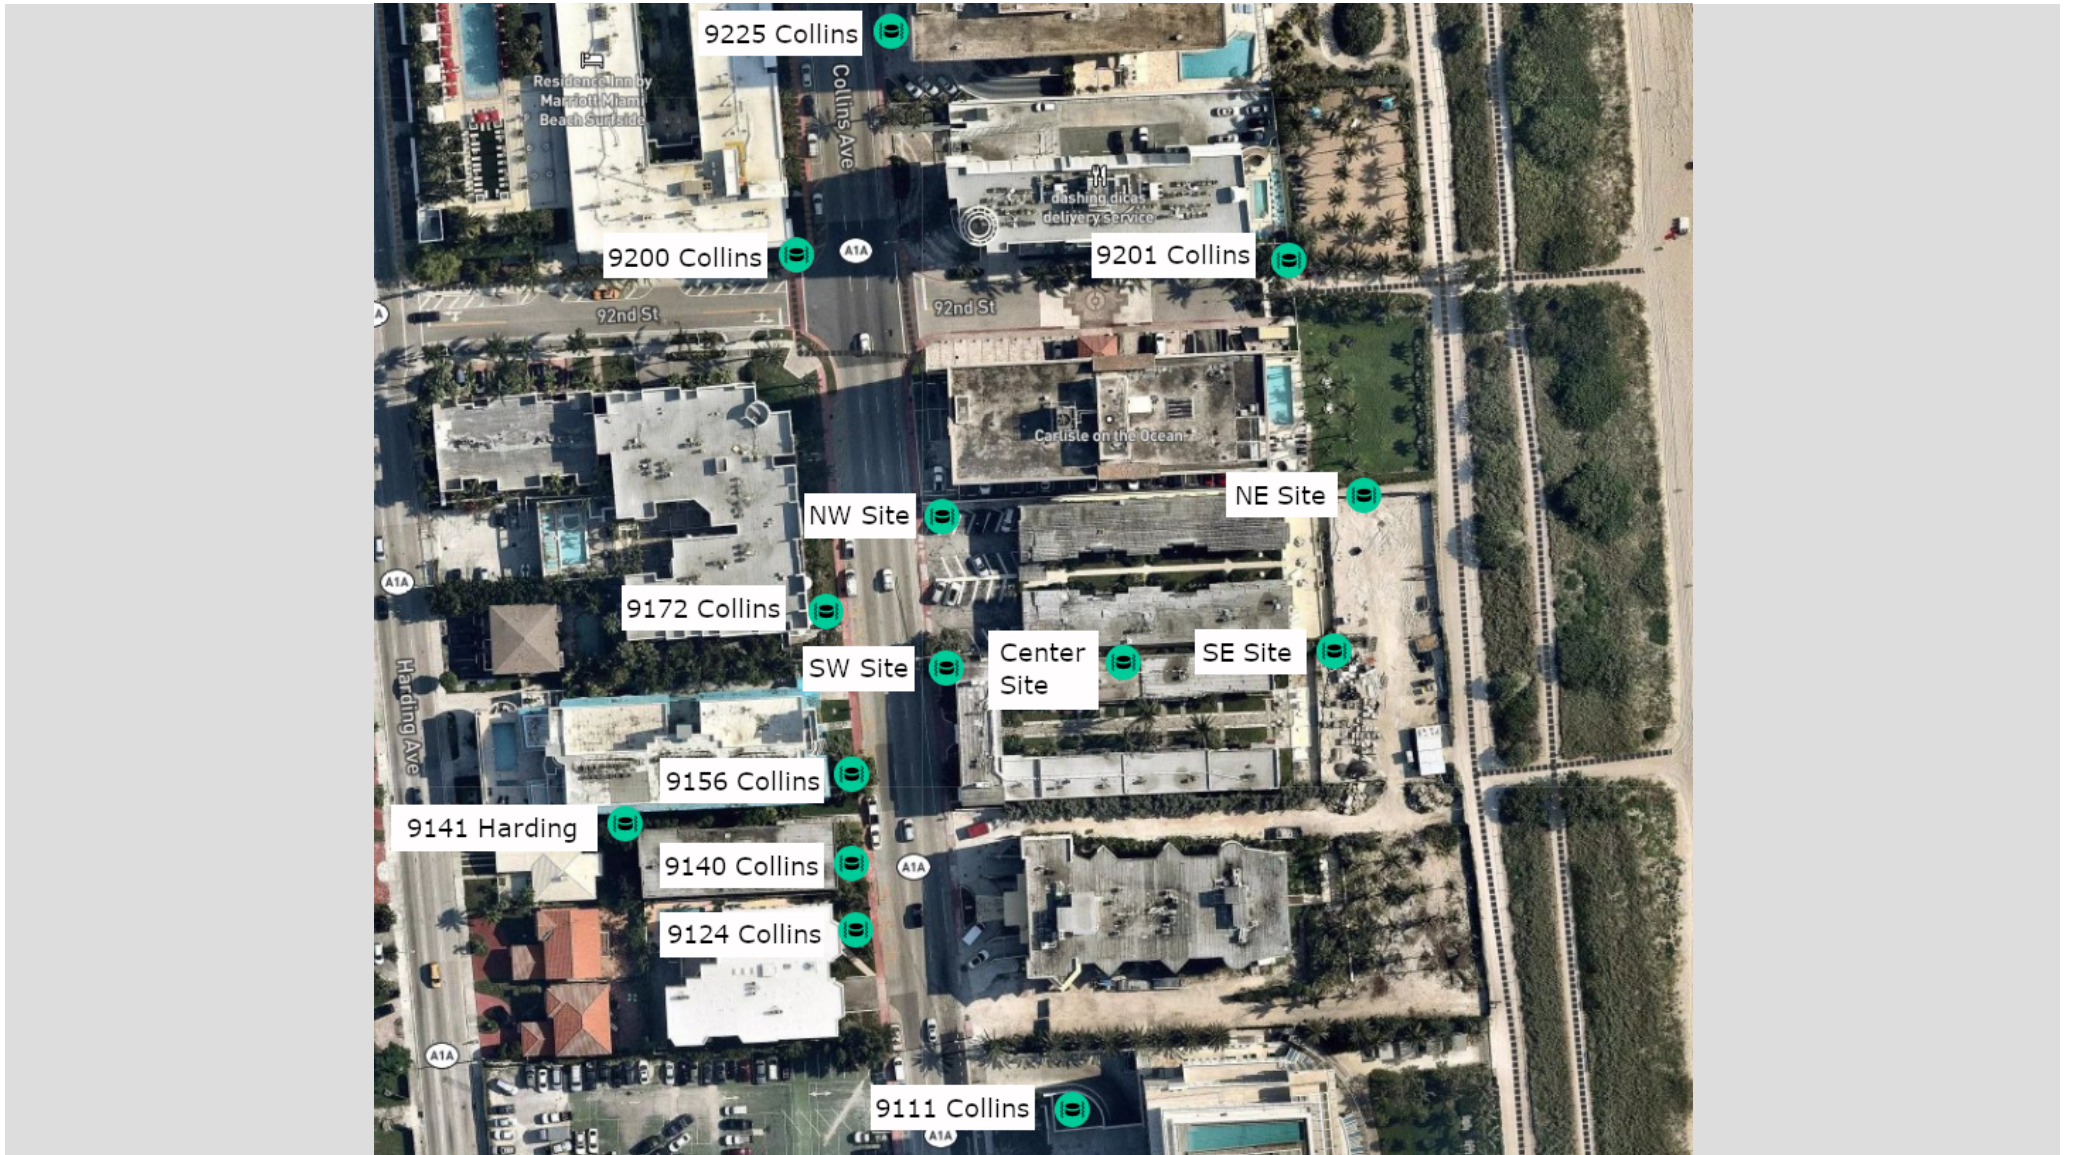

### THRESHOLD EXCEEDANCES

Below is a table of dates when readings were not recorded on the vibration monitor, along with the cause of the reason for each occurrence.
